TIPS

Il documento definisce le raccomandazioni cliniche ed organizzative utili a limitare il rischio di complicanze maggiori durante le **procedure elettive di sedazione e di anestesia**, sia generale che regionale, in età pediatrica.

Il documento è rivolto ad **anestesiologi-rianimatori** che si occupano di anestesia pediatrica, o ne sono comunque coinvolti, in misura diversa.

and EFFECTIVE analgesia”**

SAFETY CONTRADICTIONS ADVANTAGES

Complications in Pediatric Regional Anesthesia

An Analysis of More than 100,000 Blocks from the Pediatric Regional Anesthesia Network

In a prospective multicenter cohort of more than 100,000 blocks in children, there were no cases of permanent neurologic deficit associated with regional anesthesia. The rate of transient neurologic deficit was low at 2.4 per 10,000, and the incidence of local anesthesia toxicity was also low at 0.76 per 10,000.

The data from this study demonstrate a level of safety in pediatric regional anesthesia that is comparable to adult practice and confirms the safety of placing blocks under general anesthesia in children.

REVIEW

The European society of regional anesthesia and pain therapy and the American society of regional anesthesia and pain medicine joint committee practice advisory on controversial topics in pediatric regional anesthesia I and II: what do they tell us?

*Per-Arne Lönnqvist^a, Claude Ecoffey^b, Adrian Bosenberg^c,
Santhanam Suresh^d, and Giorgio Ivani^e*

Scientific evidence was obtained by performing a systematic search of literature. All committee members participated in the expert opinion decisions because all involved have had extensive experience (>20 years) on the topic.

Conclusion

Over the last 19 years, the use of epidural analgesia has been on the decline as it is gradually replaced by alternative modalities of analgesia with superior safety profiles. In keeping with global trends, we expect further growth in the area of paediatric regional anaesthesia in the near future, specifically in the fields of peripheral nerve and truncal nerve blocks. However, there remain clear indications for the use of epidural analgesia in children, and for this reason paediatric anaesthetists must retain competency and confidence in its use.
