An aerial photograph of a large regatta on a deep blue sea. Hundreds of sailboats with white sails are scattered across the water, creating a dense field of white against the dark blue. The perspective is from a high angle, looking down on the boats. The text 'BARCOLANA 55' is overlaid in the center in a large, white, sans-serif font.

next step in improving bedside
care?

Data : vast, abundant and complex

AI simplifies analysis making accessible

Clinical investigations are increasingly utilizing AI-driven models

AI's potential in critical care is still in its infancy

- Estimated 200,000 - 400,000 deaths a year
- ~ 60-120 per 100,000 head of population
- 5-10 times the death from car accidents

ANALYSIS

Medical error—the third leading cause of death in the US

WHITE PAPER

The Human Cost and Financial Impact of Misdiagnosis

KEY MESSAGES

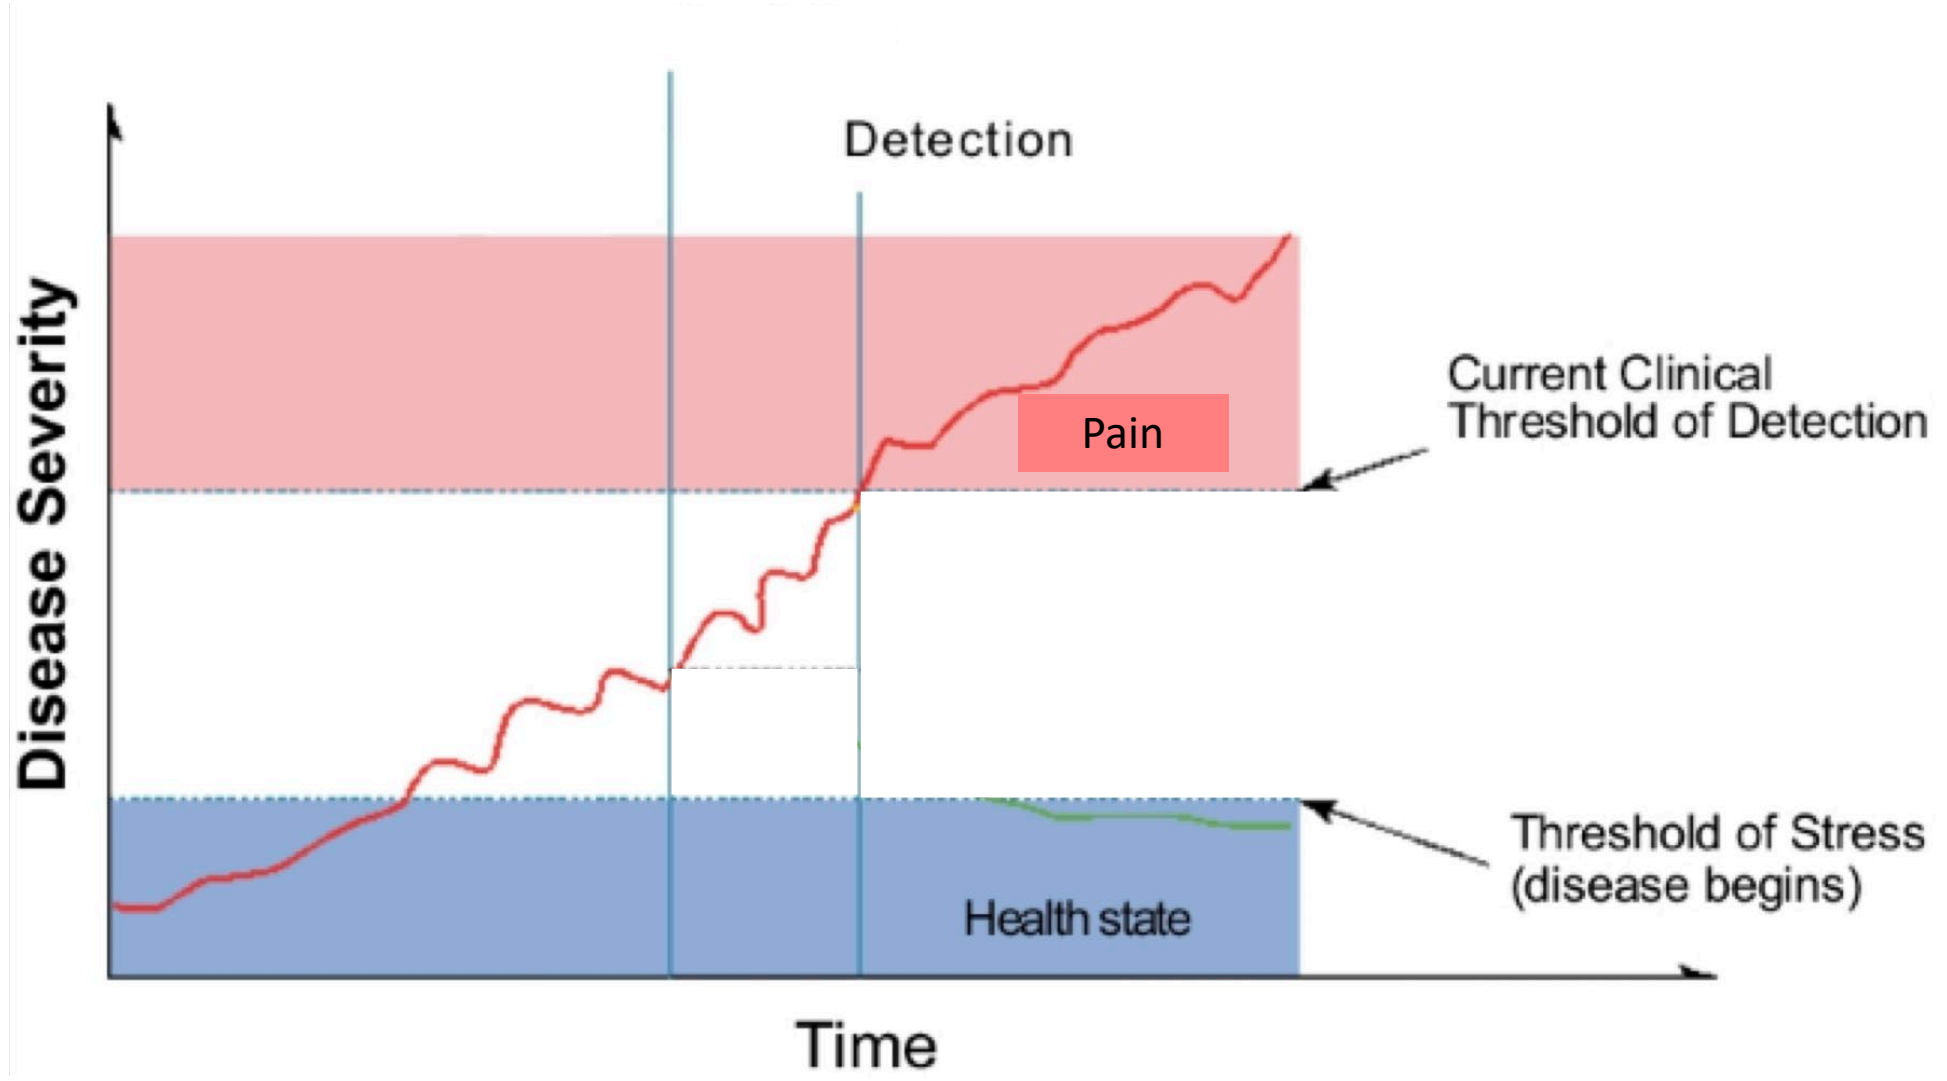

- Most Americans will experience a diagnostic error at least once in their lifetime.
- Patient deaths due to these errors are estimated at 40,000 to 80,000 per year.
- Diagnostic errors and other inefficiencies cost the U.S. economy \$750 billion each year.

Can AI also reduce errors in medicine?

Conceptual role of (AI)-driven predictive analytics on disease progression.

Yoon et al. Critical Care (2022)

40% of orthopedic of patients still experience moderate to severe postoperative pain.

PAIN

Chronic postsurgical pain in Europe An observational study

of Anaesthetists

Editorial |  **Free Access**

Using postoperative pain trajectories to define the role of regional analgesia in personalised pain medicine

30% excessive numbness or motor blockade which brings to significant limitation of activity

Journal of Clinical Anesthesia

Volume 77, May 2022, 110618

Original Contribution

Remote transmission monitoring for postoperative perineural analgesia after major orthopedic surgery: A multicenter, randomized, parallel-group, controlled trial

Xavier Capdevila MD, PhD^{a, b}  , Philippe Macaire MD^c, Nathalie Bernard MD^a,

80 pz in orthopedic surgery

Randomly assigned (RT vs BC group)

Results:

- RT, faster response time to PCA adjust (20 min) vs BCgroup (55 min)
- lower ropivacaine usage
- reduced nurse workload and costs

No differences were noted in satisfaction scores or complication rates.

Comparison of continuous with single-injection regional analgesia on patient experience after ambulatory orthopaedic surgery: a randomised multicentre trial

Axel Maurice-Szamburski^{1,*}, Philippe Grillo¹, Philippe Cuvillon², Thierry Gazeau³, Laurent Delaunay⁴, Pascal Auquier⁵, Sophie Bringuier⁷ and Xavier Capdevila⁶

- EP has higher satisfaction scores (median global EVAN-G)
- Opioid consumption (70.5 mg vs. 31.9 mg)
- Electronic activity tracking data higher levels in the EP group

Surgical block

- 2 General surgery
- 1 Vascular surgery
- 1 Neurosurgical
- 2 Urological
- 3 Orthopedic surgery
- 1 plastic surgery
- 1 ENT surgery
- 1 Robotic surgery
- 1 Emergency surgery room

Team:

- 4 nurses coordinated by a physician

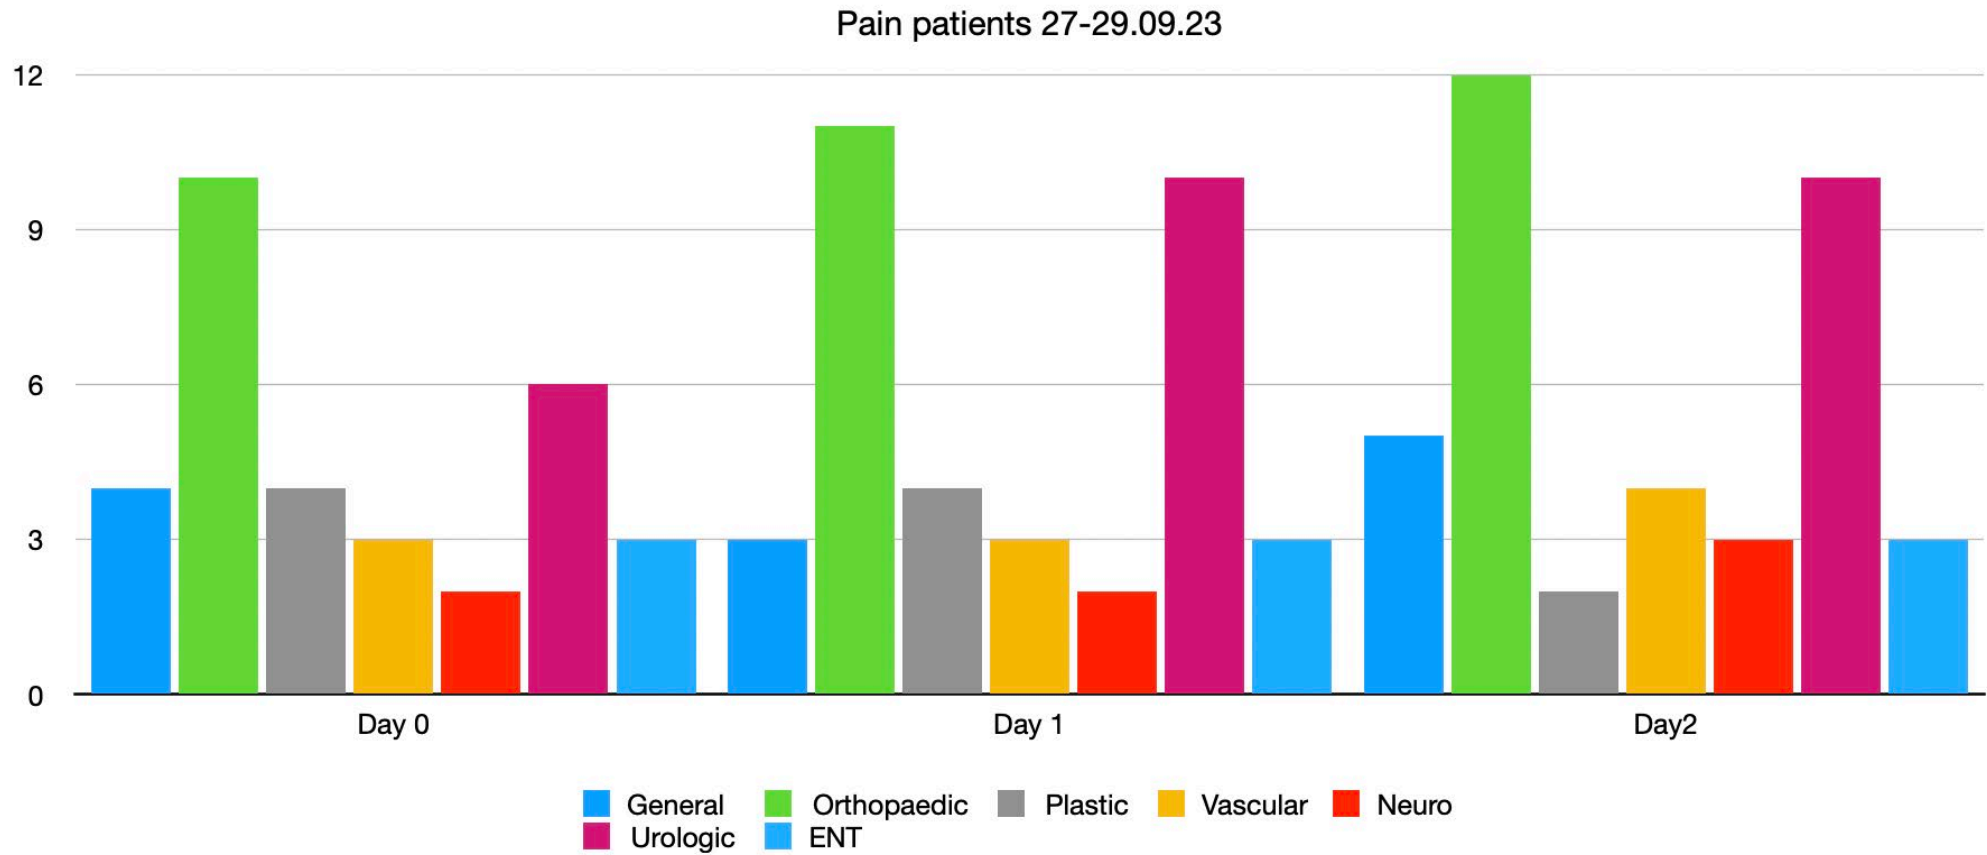

- 2018: 1604 **1774**
- 2019: 1629 **1756**
- 2020: 1165 **1301**
- 2021: 1074 **1575**
- 2022: 1016 **1812**

Post operative pain service (POPS)

Patients

- scheduled for orthopedic surgery with programmed postoperative analgesia with continuous peripheral nerve block (CPNB)

Randomly assigned into 2 groups:

- Remote transmission group
- Control Group

Aim:

- Reduce the team's workload (step count)
- Improve the patient's satisfaction (self report)

Inclusion criteria:

1. ASA <3, aged 18 or older, scheduled for orthopedic surgery
2. Postoperative analgesia plan with continuous peripheral nerve block (CPNB)

Exclusion criteria:

1. pregnancy, breastfeeding, cognitive impairment, severe coagulopathy, chronic kidney disease and peripheral neuropathy.

Information about the study during a pre-anesthetic consultation

Methods:

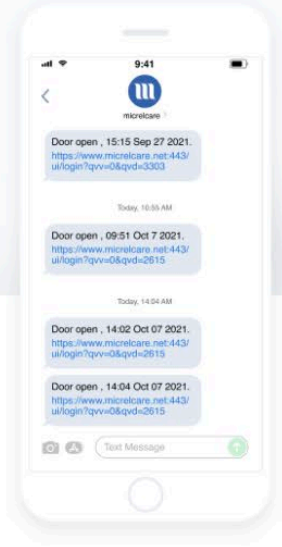

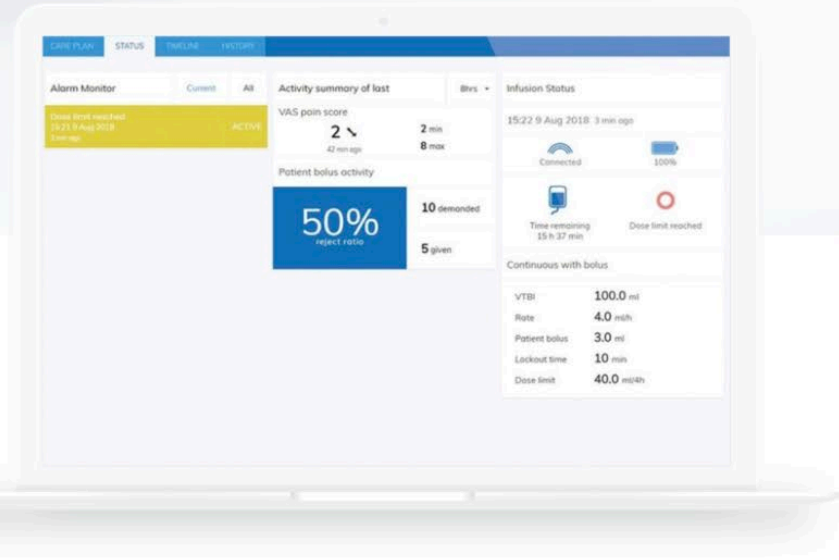

1. Standard pre anesthesia: 2 mg midazolam
2. A peri-neural catheter placed preoperatively.
3. 0.4 mL/kg of mepivacaine 1.5% injected through the catheter
4. General anesthesia induction with TCI of remifentanil and propofol
5. All patients received 1 g of intravenous paracetamol and 15 mg of intravenous ketorolac

1. Nurses prepare the pump after block validation.
2. A Mobile Communication system to the pumps for patients in the RT group
3. Continuous infusion of ropivacaine 2 mg/mL start at 5 mL/h (adjusted on BMI), with a 5 mL bolus, a 30-minute lockout time, and a maximum volume of 40 mL/4 h.
4. In the PACU rescue analgesia, if needed with morphine.

SMS NOTIFICATION

INFUSION PUMP

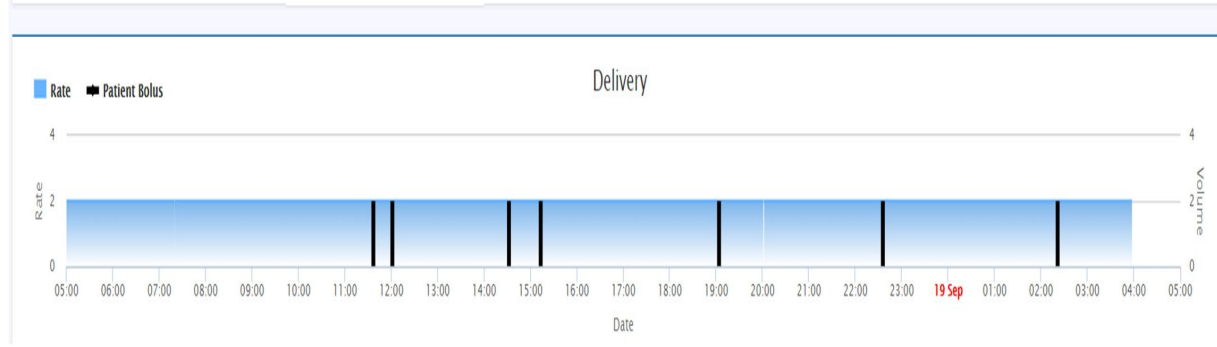

Alarm Monitor	Current	All	Activity summary of last	24hrs ▾	Infusion Status
<p>Vas pain score 9 15:39 25 Jul 2018 0 min ago</p> <p>ACTIVE</p>			<p>VAS pain score</p> <p>9 ↗ 0 min ago</p> <p>8 min 9 max</p>		<p>15:38 25 Jul 2018 0 min ago</p> <p> Connected</p> <p> 100%</p>

Il dolore alto segnalato dal paziente ha correlazione esatta con l'aumento

The severity of pain has a direct correlation with the number of boluses requested by the patient.

Results not yet indicative

- **Limited sample size:**

EP group: 4 patients

Control group: 5 patients

- **Median time of reponse:**

25 min in EP group

110 min in control group

- **Work overload:**

12560 steps EP group

9152 steps in control group

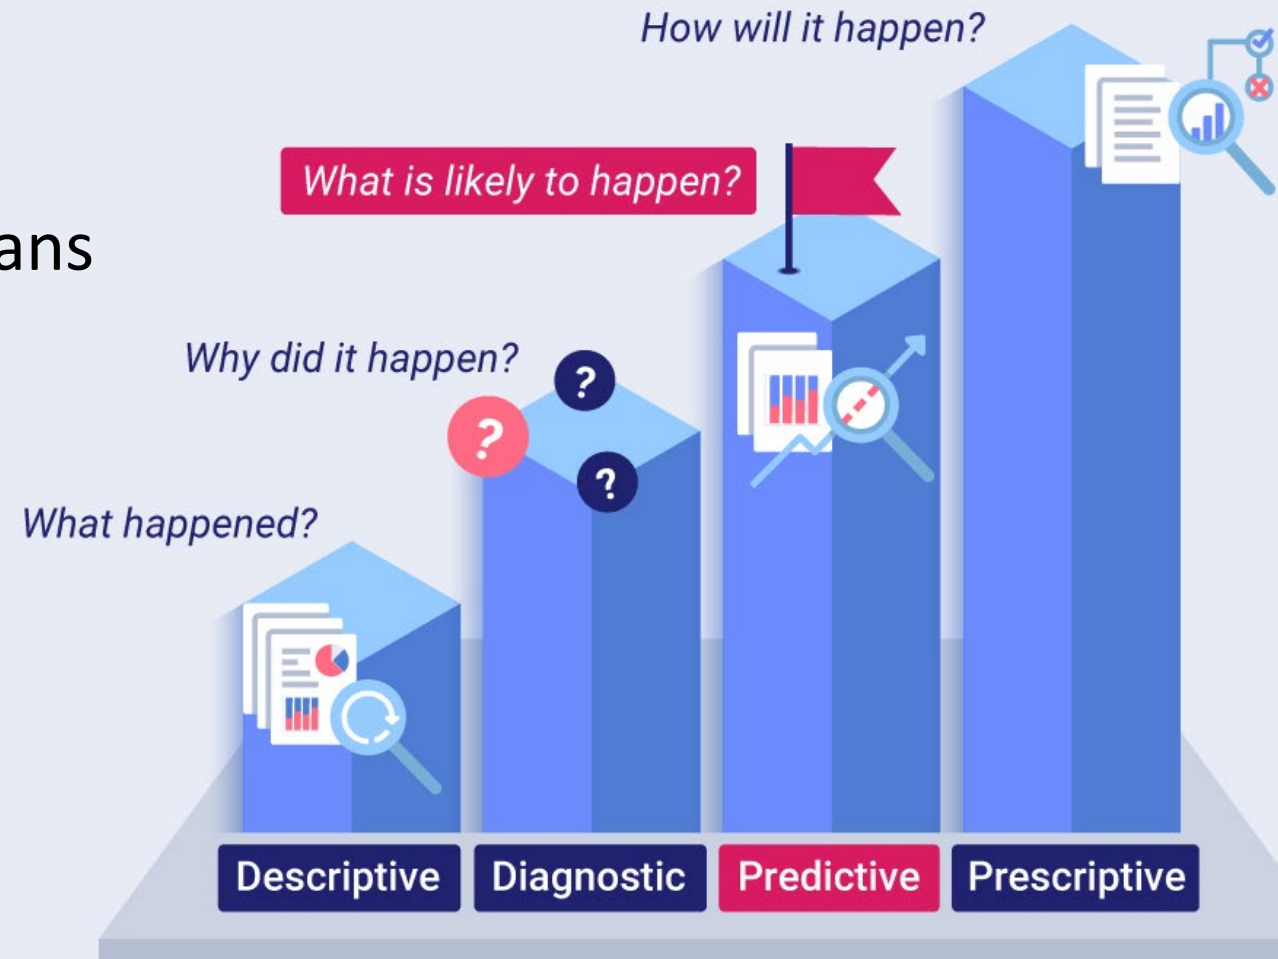

AI is having a significant impact on pain control :

- Personalized Treatment Plans
- Predictive Analytics
- Medication Management
- Telemedicine
- Sensory Feedback Devices
- Data Analysis
- Early Detection
